RECOMMENDATION

Wearers express a higher ease of reading, **the letters stand out better and the contrasts are also improved.** Some testify a great pleasure to read and **A REAL LIFE CHANGE.**

HOW DO LEXILENS WORK ?

In most people, one eye is dominant over the other. Our researchers discovered that people with dyslexia usually don't have a dominant eye. Both eyes transmit primary images and mirror images on the same quality to the brain.

Unable to sort, the brain merges the 2 images. The dyslexic reader therefore sees badly detached letters, mirrored letters (like b instead of d) words that overlap, leading to a greater effort of deciphering.

LEXILENS NEUTRALIZE THE MIRROR IMAGE.
